

# Lab 5

## Description

Based on your lab4 and the example we discuss in the class, implement the database operations in the Android coroutine.

[GitHub Repo] <https://github.com/CS683/assignment5>

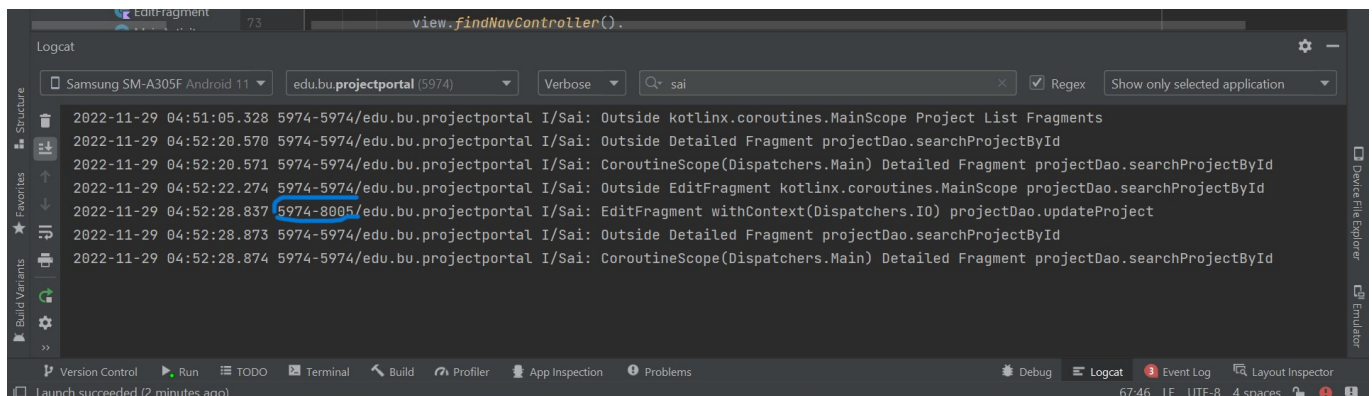

For implementation, i took lab 4, in the projectdao interface, i added "suspend" in all the interfaces except the ones which return LiveData, and used "viewLifecycleOwner.lifecycleScope.launch" which was recommended to be used inside fragments.

Problems faced was that , i tried to use "withContext(Dispatchers.IO)" for "searchProjectById" and was trying to the updating the UI with that result, i had issues, so i am using the below code, where there is a update of UI, i am running the required code in the main thread. Two instances i was able to use withContext(Dispatchers.IO) without any issues: one was in addProject and another was in updateProject(In screenshot 1, the thread id of IO thread was 8005)

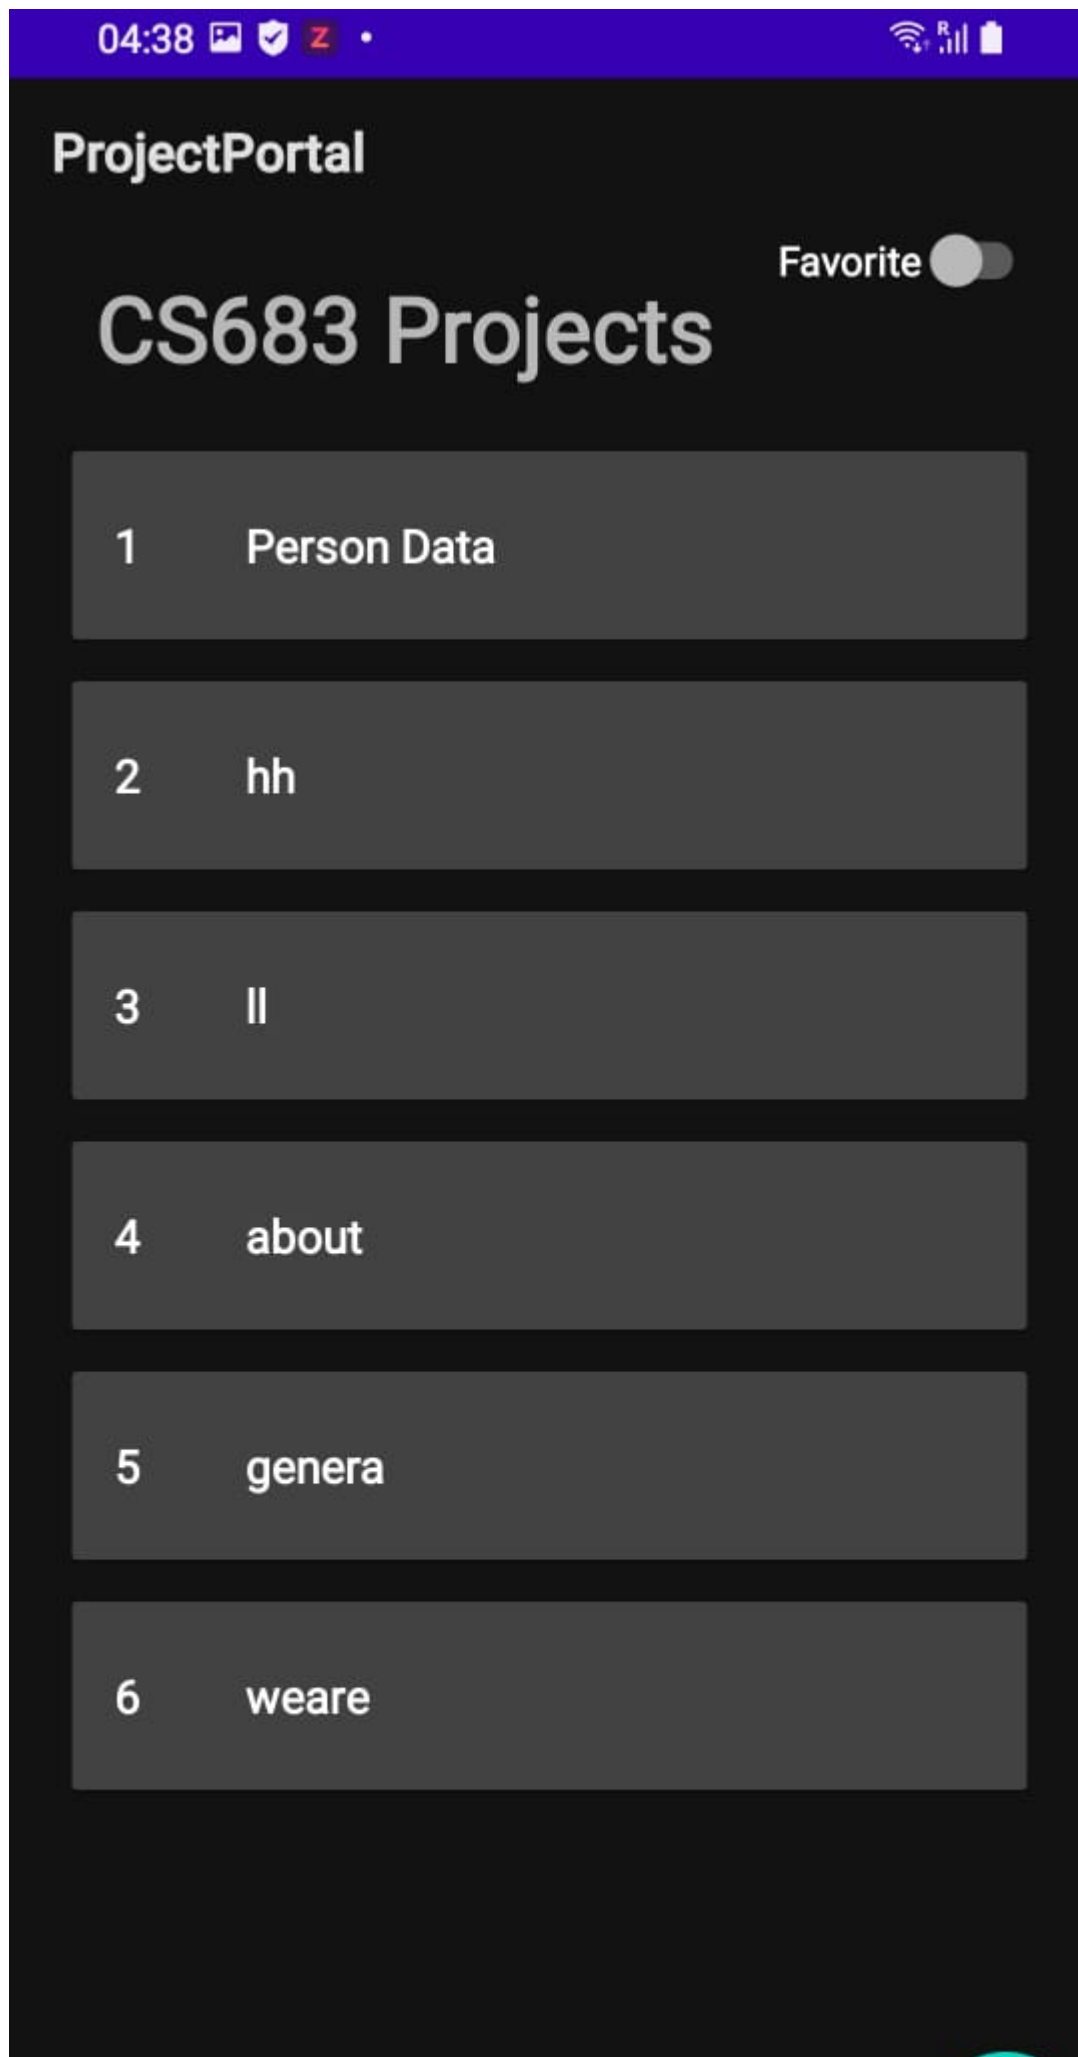

## Code Reference:

```
viewLifecycleOwner.lifecycleScope.launch {  
  
    val project = projectDao.searchProjectById(position.toLong())  
    binding.editProjTitleId.setText(project.title)  
    binding.authorsId.setText( project.authors)  
    binding.projLinkEdit.setText(project.links)  
    binding.editFavId.setChecked(project.favorite)  
}
```
